The two main cannabinoids in cannabis are THC and CBD. THC is the psychoactive compound that produces the "high" associated with cannabis use. CBD, on the other hand, is non-psychoactive and has a variety of therapeutic benefits.

Toxicology of Cannabis and Cannabinoids

The toxicology of cannabis and cannabinoids is also complex. While cannabis is generally considered to be a safe substance, there are some potential risks associated with its use.

The most common adverse effects of cannabis use are short-term and include dry mouth, red eyes, and impaired coordination. However, there is also evidence that long-term cannabis use may be associated with an increased risk of respiratory problems, mental health problems, and addiction.

Therapeutic Potential of Cannabis and Cannabinoids

Cannabis and cannabinoids have a wide range of potential therapeutic benefits. These benefits include:

- Pain relief
- Inflammation reduction
- Nausea and vomiting suppression
- Appetite stimulation
- Sleep improvement
- Anxiety and depression reduction

Cannabis and cannabinoids are currently being investigated for the treatment of a variety of conditions, including chronic pain, multiple sclerosis, epilepsy, and cancer.
